

**=== CONFIDENTIAL: THE GROVE INCIDENT ===**

JIRA SEC-1198 (DECRYPTED)

Priority: P0 (CRITICAL - SYSTEM FAILURE IMMINENT)

Issue: Auth token replay vulnerability in Version 3.0-RC1

Reporter: Harsh Bhimrajka (18:50 PM)

Status at launch: DEFERRED BY PRODUCT COUNCIL

DETAILS:

A race condition exists in the Session Manager. If the system is power-cycled during a shadow-deploy, all root-level access codes are cached in plain text and can be replayed to unlock physical security zones.

REPORTER COMMENT (Harsh): "Found the leak. It's bad. If we deploy now, the server room locks might fail in a failover state. But it's 7 PM and I'm headed out. We can patch Monday."

LEADERSHIP COMMENT (Siddak/Neil): "Risk accepted. Neil told me to ignore it. Ship now. We have a valuation to protect. Patch after the launch party."
